WHAT IS MESHCORE?
MeshCore is open source software that lets small, dedicated radios pass messages across a mesh network. It works without the internet or a commercial provider.

WHAT DOES IT COST?
To get started, all you need is a companion (MeshCore's name for the role of the radio at the receiving end). You can get one from 15 euros, and a good one usually costs about 40. There are no running costs such as a subscription, and you do not need to register.

HOW DO I JOIN?
Our website lists groups near you. They are volunteers who know the mesh and help you set up. You can also read up on it and just start. It is easier than you think!

A repeater on your roof?

In many places the mesh is already well built out, so you often do not need a repeater of your own. Where coverage is poor, a repeater can help. With a clear view and good height it can pass messages on over long distances. You can buy one ready-made or build your own. A repeater is a radio, a solar panel and batteries with charge controllers.

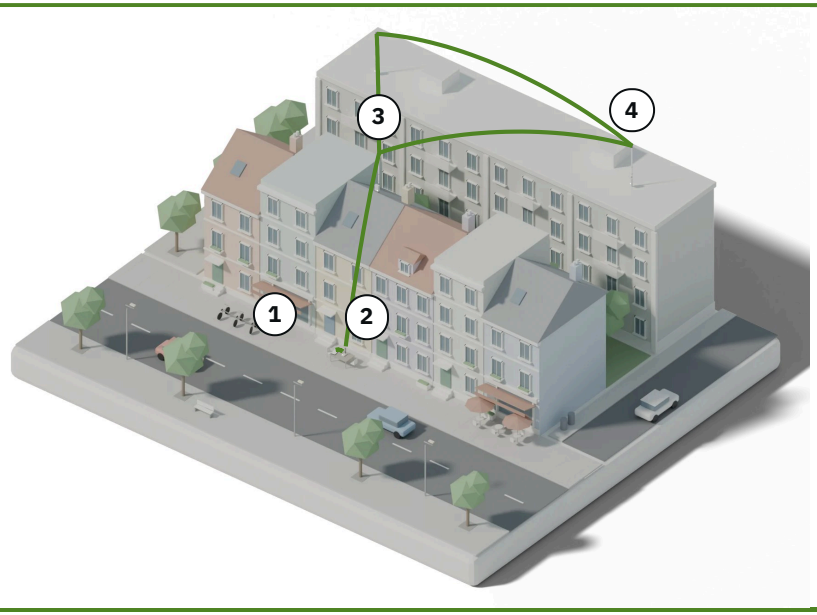

Does it use my internet?
No. The radios use licence-free frequencies. They need no WiFi. Repeaters have solar panels and batteries, so they keep running in a power cut.

Is it allowed?
Yes. Part of the 868 MHz band is free to use across Europe. A repeater needs no licence either. You do have to follow the rules.

How does it work?

You control your companion from your phone or computer. Your companion then sends your messages by radio to the nearest repeater. From there they hop from roof to roof until they reach the recipient. These radios bridge several kilometres.

1. Phone or computer
2. Companion: the radio you carry with you
3. Repeater: passes messages on
4. Other repeaters, roof to roof

- When the mobile network is down, the mesh can still reach your family and friends nearby. Many repeaters run on small solar panels and batteries. Whether it really works in an emergency, nobody knows.
- Direct messages are encrypted end to end. Public channels are public, like a chat room.
- Short text messages only: no voice, photos or internet.
